

What a raise costs, state by state

Fifty states and the District of Columbia, eleven household shapes, one earnings scale — from \$0 past 400% of the poverty line for that household. Each figure is the worst single \$1,000 step of earnings in that state's curve for that household — how much net income falls when pay goes up by a thousand dollars.

A *cliff* is a \$1,000 raise that cuts net income by \$200 or more; a *danger zone* is a run of earnings across which the household never gets ahead. The figures come from [PolicyEngine](#), an open-source tax-and-benefit calculator, run by HotGap. Estimates only.

Largest one-step loss, by state

1 adult, 2 children (3 and 7), renting in the state's most populous county. Net income lost in the worst single \$1,000 step of earnings.

Texas — \$13,938 lost at \$77,000 → \$78,000, when CCDF child care subsidy ends. Renter, Harris County. [Details below ↓](#)

HotGap, from PolicyEngine 2026 rules on policyengine-us 2.6.2. Weekly run of Sep 16, 2026. Net income after health-insurance premiums. Estimates only. Bins: five equal-width steps from \$5,190 to \$33,587 over the 50 states with a comparable figure; 1 with no cliff found.

Ranked

Corrections applied in Texas (3)

Texas — \$13,938 lost at \$77,000 → \$78,000, when CCDF child care subsidy ends. Renter, Harris County.

What HotGap changed on top of PolicyEngine before any figure for Texas was read. Child-care subsidy: added by HotGap for Texas.

Medicaid — parent income limit

overridden

HotGap sends the state's own published parent Medicaid income limit for this household's size, as a share of the 2026 poverty line including the MAGI disregard, because PolicyEngine's figure is five years out of date (policyengine-us #9474; fixed upstream in PR #9475). fhs.texas.gov

CCDF child care subsidy

added by HotGap

PolicyEngine computes the child-care subsidy but leaves it out of net income here, so HotGap adds it back, until the engine's own fix (policyengine-us #9405, PR #9503) reaches this endpoint.

Premium tax credit — coverage gap

applied

In this non-expansion state an adult with no Medicaid and no premium credit below 100% of the poverty line is charged no marketplace premium, and the point is flagged, because PolicyEngine bills the full premium to someone the marketplace would not enrol (policyengine-us #9472).

Energy assistance (LIHEAP)

not counted

Stops at 150% of the poverty guideline, the heating limit for FY2026. Worth \$1,200 a winter if received, at that top income band. Fewer than 1 in 10 income-eligible households were served in FY2024 (3%).

Limit and amount: liheapch.acf.gov. Households served: liheappm.acf.gov. Read Sep 16, 2026.

No cliff found (1)

NM no cliff

No step down of \$200 or more anywhere on this household's curve. A measurement of zero, not the smallest loss: these states are left out of the bins.

Bins are recomputed for every measure — equal-width steps of a dollar measure, classes of whole numbers for a count — so a shade means nothing across two different measures. Read the bin bounds, not the colour.

Estimates only. Rules: 2026. Rent: HUD Office of Policy Development and Research, Fair Market Rents; FY2026 revised schedule (effective 2025-10-01). County: Harris County (the state's most populous; Vintage 2024 (July 1, 2024 estimates)). Child-care price: county price, 2018 study, carried to 2026 dollars by the BLS Employment Cost Index. Model: policyengine-us 2.6.2. Weekly run of Sep 16, 2026.

All 51, every measure

Largest one-step loss — Net income lost in the worst single \$1,000 step of earnings.

Worst step — The \$1,000 step of earnings at which the largest one-step loss lands.

Total width of the danger zones — Earnings spanned by every stretch where more pay leaves the household no better off, all such stretches added together.

The leap — The raise a household must clear in one move to get past its worst danger zone.

Safe exit — Earnings above which no danger zone remains: where the last one closes.

Number of cliffs — Steps down of \$200 or more anywhere on the curve.

Deferred cliffs — Of the cliffs counted, those that land at a later renewal rather than with the raise: Head Start's program-year carry-over, a child's 12 months of continuous Medicaid or CHIP, a parent's Transitional Medical Assistance.

Figures — Complete, or the program the model cannot compute in that state, which makes the row's figures floors; and whether HotGap added the child-care subsidy to net income, where PolicyEngine had left it out.

All six measures for 1 adult, 2 children (3 and 7), by state. PolicyEngine 2026 rules, run of Sep 16, 2026.

Every row keeps the number the model returned, including the rows it cannot complete, because a reporter needs to see what came back. Those rows are flagged in the last column and are not shaded on the map or placed in the ranking. Select a state on the map or in this table to read the corrections behind its numbers under the map; the arrow keys move between states and Enter selects.

How these numbers were made

- Every cell is one household shape run through [PolicyEngine](#), an open-source tax-and-benefit calculator, at 2026 rules, earnings varied in \$1,000 steps from \$0 past 400% of the poverty guideline for that household size, plus \$40,000 of room to recover.
- For 1 adult, 2 children (3 and 7) the axis runs from \$0 to \$150,000 (\$175,000 in Alaska, \$165,000 in Hawaii); a figure that runs past the axis runs past that.
- The money line is **health-adjusted**: household net income minus what the household actually pays in health-insurance premiums, net of the marketplace subsidy. Deductibles and copays are not included.
- Each household is a typical renter in the state's most populous county — named under the map for the selected state — with HUD Fair Market Rent, Census county estimates, and the DOL National Database of Childcare Prices preschool price for that county, carried to 2026 dollars by the BLS Employment Cost Index. The study year behind the price, and whether a state or national median stood in for a county the database lacks, differ by state and are printed in the source line under the map.
- The CCDF child care subsidy is **on** for this run and off for a household's own lookup. Head Start and housing vouchers are off in both: they are rationed, and assuming a family holds one inflates its numbers.
- Cliffs deferred to a future renewal — Head Start's program-year carry-over, a child's 12 months of continuous Medicaid or CHIP eligibility, a parent's Transitional Medical Assistance — are counted in the *deferred* column and are lifted out of every other figure here. They are real losses; they do not land in the year of the raise.
- Where a state's figure needed a correction on top of PolicyEngine — a premium ladder applied locally, the child care subsidy added back into net income, a parent Medicaid limit taken from the state's handbook, a coverage-gap premium — it is listed under the map for the selected state, from the run's own coverage record, not from copy kept here.
- The download is the table's rows in the table's order, one per state, with these columns: state, state_name, archetype_id, archetype, biggest_one_step_loss, biggest_loss_at, biggest_loss_programs, danger_zone_width, leap, safe_exit, cliff_count, deferred_cliff_count, leap_is_lower_bound, no_cliff_found, comparable, figures, unmodeled_programs, corrections_applied, childcare_subsidy_footing, liheap_limit, liheap_served_share, county_name, county_fips, rent_vintage, county_vintage, childcare_price_vintage, policy_year, sweep_generated, model_label, model_endpoint, model_version,

source. Empty dollar cells are a state with no cliff or a safe exit past the axis; the flags say which figures are floors or lower bounds.

What the model does not include

- Immigration status, assets, and household members aged 65 or over are not inputs.
- Alaska and Hawaii marketplace subsidies are computed upstream against the 48-state poverty guideline rather than their own higher ones ([reported to PolicyEngine](#)). HotGap does not correct this, so both states' premium-driven figures are understated.
- Energy assistance (LIHEAP) is in no figure on this page, except in Michigan, where it is paid as the Home Heating Credit and counted. It is a block grant, not an entitlement: in FY2024 the states served between 3% (Texas) and 85% (Michigan) of their income-eligible households, so a curve that assumed it would draw a benefit most eligible families never receive. Each state's block under the map says where it stops, what it pays there and the share served; the download carries the limit and the share.
- Nothing the model cannot compute would move this household's figures in any state, so no state is hatched for 1 adult, 2 children (3 and 7).

Hatched is not low. A program the model cannot compute in a state — is missing from every figure for it, so its numbers are floors, not measurements. Do not write that those states are gentler; the only honest claim is that this model cannot yet say. The flag is read from the run's own coverage record, not from a list kept here, so a state drops off it the day the engine starts modelling the program.

Past the axis is not a number. Where a state's *last* danger zone runs off the top of the axis rather than closing, the safe exit is unknown; the leap is a lower bound only when the *worst* zone is the one that runs off. The two can differ, so a state can show an exact leap and no safe exit. Those cells read *past the axis* here and must not be charted as a value.
